Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

USpatents@armstrongteasdale.com

Office Action Summary

Application No.

10/733,866

Applicant(s)

HILL ET AL.

Examiner

DAVID E. ENGLAND

Art Unit

2443

Period for Reply -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 June 2010.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1, 6 - 15, 17, 22 - 32 and 35 - 45 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1, 6 - 15, 17, 22 - 32 and 35 - 45 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB06)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ ~~Notice of Informal Patent Application~~
- 6) ☐ Other: _____

DETAILED ACTION

1. Claims 1, 6 – 15, 17, 22 – 32 and 35 – 45 are presented for examination.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. **Claims 1, 6 – 15, 17, 22 – 32 and 35 – 45 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tunncliffe et al. (6272110), hereinafter Tunncliffe, in view of Datta et al. (6209033), hereinafter Datta, in further view of Vogl et al. 7403994, hereinafter Vogl.**
4. Referencing claim 1, as closely interpreted by the Examiner, Tunncliffe teaches a method of maintaining bandwidth capacity of a network comprising:
5. defining future times at which a bandwidth capacity of the network is evaluated, (e.g., col. 4, lines 20 – 59);
6. determining a total bandwidth capacity of the network (TNC) at each of the future times, (e.g., col. 4, lines 20 – 59);
7. determining a total demand of users (TUD) for the network at each of the future times, (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55);

8. determining, by a processor, a predicted utilization (PU) of the network at each of the future times as a function of the total demand of users (TUD) and the total bandwidth capacity of the network (TNC), (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55);
9. defining a maximum acceptable utilization of the network at each of the future times, (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55);
10. comparing, by a processor, the predicted utilization (PU) of the network to at least one of the maximum and minimum acceptable utilization of the network at each of the future times, (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55); and
11. based upon said comparing, defining an adjusted predicted utilization (APU) at each of the future times, said defined APU being between the maximum and minimum acceptable utilization of the network, (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55, It is interpreted that the APU is the PU that is actually implemented.);
12. determining, for each future time, a change in network bandwidth capacity (DCNC) to be applied to the network in order to increase or decrease the bandwidth capacity of the network to maintain the defined APU, (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55), but does not specifically teach the change in total network;
13. defining a maximum acceptable utilization and a minimum acceptable utilization of the network.
14. Datta teaches the change in total network, (e.g., col. 6, line 65 – col. 7, line 9);
15. defining a maximum acceptable utilization and a minimum acceptable utilization of the network, (e.g., col. 3, lines 11 – 35, upper and lower);

16. comparing, by a processor, the predicted utilization (PU) of the network to at least one of the maximum and minimum acceptable utilization of the network, (e.g., col. 11, line 60 – col. 12, line 7);

17. based upon said comparing, defining an adjusted predicted utilization (APU) at each of the future times, said defined APU being between the maximum and minimum acceptable utilization of the network, (e.g., col. 11, line 60 – col. 12, line 7).

18. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Datta's changing of the entire network and multiple bandwidth thresholds with Tunnicliffe's teachings of specific changes in bandwidth and client capacity since it has been held that mere duplication of parts, i.e. utilizing Tunnicliffe's one device increase or decrease of bandwidth in multiple devices that would make up an entire network such as Datta, would only take one of ordinary skill to perform, In re Harza, 274 F.2d 669, 124 USPQ 378 (CCPA 1960). Furthermore, utilizing multiple thresholds, i.e., max and min, allows the system to monitor a client and keep them in an acceptable range so that the client does not go over or too under what they are allotted. Tunnicliffe and Datta do not specifically teach determining at each of the future times a lead time for adding a product for applying the determined DCNC to the network, wherein the lead time indicates an amount of time needed for delivery and installation of purchased DCNC; and

19. in advance of each of the future times based on the lead time determined with respect to each of the future times, initiating efforts to obtain the product for applying the determined DCNC.

20. Vogl more clearly teaches determining at each of the future times a lead time for adding a product for applying the determined DCNC to the network, wherein the lead time indicates an amount of time needed for delivery and installation of purchased DCNC, (e.g., col. 10, line 12 – col. 11, line 29, col. 11, line 63 – col. 12, line 57); and
21. applying the determined DCNC in advance of each of the future times based on the lead time determined with respect to the future times, (e.g., col. 10, line 12 – col. 11, line 29, col. 11, line 63 – col. 12, line 57).
22. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Vogl with the combine inventions of Tunncliffe and Datta's because allowing a time for a user to determine if there is a need for more “product” allows the system to better tailor to the needs of the user and develop a “product” that fits their needs.
23. Referencing claim 6, as closely interpreted by the Examiner, Tunncliffe teaches determining a total bandwidth capacity of the network (TNC) at each of the future times is a function of determining a present bandwidth capacity of the network (PNC) and identifying a planned change in network bandwidth capacity (PCNC) to be applied the network between a present time and each of the future times , (e.g., col. 3, lines 22 – 55).
24. Referencing claim 7, as closely interpreted by the Examiner, Tunncliffe determining a change in network bandwidth capacity (DCNC) is a function of one or more of the following:
25. a current utilization (CU) of the network, a growth trend of a utilization of the network, or a cost measure of a bandwidth capacity to be added to the network , (e.g., col. 3, lines 22 –

55).

26. Referencing claim 8, as closely interpreted by the Examiner, Tunnickliffe teaches said current utilization (CU) of the network is indicative of a high percent usage of a present bandwidth capacity of the network (PNC) for a particular percentage of time , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

27. Referencing claim 9, as closely interpreted by the Examiner, Tunnickliffe teaches the growth trend is based on a regression of data representative of a past growth of the utilization of the network , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

28. Referencing claim 10, as closely interpreted by the Examiner, Tunnickliffe teaches determining a total demand of users (TUD) for the network at each of the future times is a function of determining a present demand of users (PUD) for the network and determining a change in demand of users (CUD) for the network between a present time and each of the future times , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

29. Referencing claim 11, as closely interpreted by the Examiner, Tunnickliffe teaches determining an anticipated change in demand of users (CUD) for the network comprises determining a demand requirement for a roll-out of an application operating via the network , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

30. Referencing claim 12, as closely interpreted by the Examiner, Tunncliffe teaches determining a predicted utilization (PU) of the network at each of the future times comprises dividing the total demand of users (TUD) for the network by the total bandwidth capacity of the network (TNC) at each of the future times , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

31. Referencing claim 13, as closely interpreted by the Examiner, Tunncliffe teaches the acceptable utilization of the network is a function of a response time of an application operating via the network , (e.g., col. 3, lines 22 – 55).

32. Referencing claim 14, as closely interpreted by the Examiner, Tunncliffe teaches the response time of the application is a function of one or more of the following:

33. a distance between a client and a server of the application wherein said client and server are coupled to the network, a connection speed of the client to the network, or a utilization of the network during a period of time at which the client accesses the application , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

34. Referencing claim 15, as closely interpreted by the Examiner, Tunncliffe teaches planning a budget for applying the determined change in network bandwidth capacity (DCNC) to the network and determining a cost measure of the determined change in network bandwidth capacity (DCNC) , (e.g., col. 4, lines 20 – 59, col. 5, lines 4 – 55).

35. Claims 16, 17, 22 – 32 and 35 – 45 are rejected in the same light as the above claims and their teachings can also be found in the above cited areas of the prior art.

36. Claim 42 is rejected under 35 U.S.C. 103(a) as being unpatentable over Tunnicliffe, Datta and Vogl in further view of Westphal (2004/0202160).

37. As per claim 42, as closely interpreted by the Examiner, Tunnicliffe, Datta and Vogl teach a type of determining a cost measure of the determined change in network bandwidth capacity comprises determining a monetary cost measure of the determined change in network bandwidth capacity by analyzing past trends of cost increases or decreases for networks, (see above cited areas of both references), but does not teach of similar size, distance, and location. Westphal teaches network clusters that are identical in topology and load balancing between the two identical networks based on how much load is on one cluster or its cost as it can be interpreted, (e.g., ¶ 0019, 0025). It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Westphal's ability to determine load or the cost of two identical networks with the combine teachings of Tunnicliffe, Datta and Vogl that teach the prediction of network capacity of a network since, in the combination of the references, if the two networks are identical, than it would be obvious to utilize the same cost of one network with the other since they have the same traits, i.e., size and distance.

Response to Arguments

38. Applicant's arguments filed 06/10/2010 have been fully considered but they are not persuasive.
39. In the Remarks, Applicant argues in substance that the prior art does not teach the pending claims.
40. Applicant's arguments fail to comply with 37 CFR 1.111(b) because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references.
41. **Applicant is invited to contact the Examiner for an interview if they feel it would aid in furthering prosecution and coming to an agreement on claim language.**

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DAVID E. ENGLAND whose telephone number is (571)272-3912. The examiner can normally be reached on Mon-Thur, 7:30-5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tonia Dollinger can be reached on 571-272-4170. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
